ISWC 2026 · HALF-DAY TUTORIAL

Façade-X: Querying Any Format as a Knowledge Graph

Integrate CSV, JSON, XML, spreadsheets and more using SPARQL alone.

📍 Bari, Italy · 📅 25 October 2026 · ⏱️ 14:10–18:00

SPARQL | Knowledge Graphs | Data Integration | Hands-on

FX ISWC Tutorial - Hands-on with SPARQL Anything: guided exercises

In these exercises you build data integration pipelines with the **SPARQL Anything command line interface (CLI)**, using real data from the Tate collection: artists and artworks published as CSV, JSON and Markdown (CC0).

Each step is shown twice: as a terminal command (`!java -jar …`) and with PySPARQL Anything, the Python library that runs the same engine.

You need: a Google account to run the notebook in Colab, and basic SPARQL (`SELECT`, `CONSTRUCT`, `SERVICE`). Nothing to install on your machine.

Exercises

#	Exercise	You will learn to…	Key features
0	Install the CLI	run SPARQL Anything from a single jar, and from Python	`-q`, `-f`, `fxe:content`
1	From a CSV file to a knowledge graph	see how Façade-X represents a table, and map it to your own vocabulary	`csv.headers`, `csv.null-string`, `fx:cardinal`, `fx:entity`, `-o`
2	Two formats, one query	join JSON from the Web with a local CSV in a single query	`rdfs:member`, remote `location`, datatypes in joins
3	From a query to a pipeline	turn a query into a template and run it once per row of a result set	`?_` parameters, `-v`, `-p`
4	A folder as a data source	query every file in a folder with one query	folders, `archive.matches`, nested `SERVICE`
5	Reuse what you built	query the RDF you produced and use a saved query as a source	`-l`, `query=`
6	Scaling up	convert ~69,000 rows with limited memory, and turn the graph back into a table	`slice`, `-st`, `-f CSV`
7	Documents and text	read the same file as a structured document or as plain text	Markdown, `media-type`, `txt.regex`
